SMART GLAMPING ECOSYSTEM

MASTER BLUEPRINT

Business, Operational & Digital Transformation Plan

Blueprint untuk diskusi awal dengan owner glamping premium di Bali

BASELINE DOCUMENT

12-unit premium glamping | Bali | owner discussion version

Includes operating model, digital roadmap, financial scenarios and 90-day action plan.

How to Use This Blueprint

Dokumen ini disusun agar pembicaraan tidak berhenti pada ide aplikasi, tetapi bergerak menuju keputusan bisnis yang dapat dieksekusi.

What this blueprint answers

Apa yang dibangun, proses bisnis yang disentuh, prioritas MVP, teknologi pendukung, risiko, biaya digital, KPI, serta keputusan owner yang dibutuhkan.

What this blueprint does not replace

Site survey, legal due diligence, market validation lokasi spesifik, desain arsitektur, RAB konstruksi, studi lingkungan, dan feasibility study bankable.

BASELINE ASSUMPTIONS USED FOR DISCUSSION

Assumption	Working Baseline
Property concept	Eco-luxury glamping with nature-based experience and modern digital service
Baseline inventory	12 keys / accommodation units
Alternative scenarios	8-key lean pilot and 20-key growth scenario
Location context	Bali; exact regency and site not yet specified
Target segments	Couples, wellness travelers, small families, digital nomads, retreats
Financial purpose	Illustrative decision support only; not an audited investment projection

Table of Contents

A complete owner discussion document: strategy, operations, technology and execution.

01	Executive Direction Section overview and detailed working pages	4-7
02	Market Context & Positioning Section overview and detailed working pages	8-13
03	Business & Operating Model Section overview and detailed working pages	14-21
04	Smart Glamping OS Section overview and detailed working pages	22-34
05	Delivery, Finance & Control Section overview and detailed working pages	35-48
06	References & Appendices Section overview and detailed working pages	49-52

Executive Summary

Aplikasi bukan produk tambahan. Ia menjadi operating backbone untuk menjalankan glamping secara disiplin sejak hari pertama.

BASELINE PROPERTY

12 units

Discussion scenario

IMPLEMENTATION

3 phases

MVP to AI layer

CORE PRINCIPLE

Digital first

Not app-first

PRIMARY OUTCOME

Control

Visibility & service

STRATEGIC RECOMMENDATION

- Build a premium glamping operation with a strong physical experience, then make the operating system part of the property design from the beginning.
- Start with a focused MVP: reservation, occupancy calendar, guest CRM, housekeeping, service request, reporting and basic payment integration.
- Use OTA channels for distribution but protect direct booking capability through a branded website, WhatsApp flow and guest database.
- Add AI only after core data is clean: property-specific concierge, response drafting, upsell recommendations, review analytics and demand insights.
- Treat the first property as a living laboratory. The long-term option is a repeatable operating template for additional properties.

OWNER TAKEAWAY

The correct first decision is not whether to build AI.

The first decision is whether the glamping business will run with one source of truth from day one.

The Core Thesis

A premium nature destination becomes more valuable when the guest experience and the internal operation are designed as one system.

PHYSICAL EXPERIENCE

- Strong site concept
- Comfortable rooms
- F&B and activities
- Hospitality standards

OPERATING DISCIPLINE

- Clear SOP
- Room readiness control
- Accurate reservations
- Service accountability

DIGITAL BACKBONE

- Single guest profile
- Real-time dashboard
- Integrated requests
- Traceable transactions

AI ENABLEMENT

- Concierge assistance
- Review analytics
- Demand insight
- Smarter upselling

Value is created when these four layers reinforce each other.

Technology cannot compensate for weak hospitality. It should make good hospitality repeatable, measurable and scalable.

Decision Framework for the Owner

The proposal is structured around four business questions.

1

Can the operation run cleanly?

Reservation accuracy, room readiness, task ownership, daily reconciliation.

2

Can the guest feel the difference?

Fast response, convenient booking, relevant offers, personalized communication.

3

Can management see the truth?

Occupancy, revenue, unit status, service quality, channel performance.

4

Can the model scale?

Repeatable SOP, modular system, controlled integrations, standard KPI.

Recommended Scope of Engagement

A realistic initial engagement should combine business process mapping, MVP system design and an implementation roadmap.

Workstream	Focus	Expected Output
Workstream 1	Business process discovery	Map booking, payment, check-in, service request, housekeeping, checkout and reporting.
Workstream 2	MVP product definition	Define users, modules, workflow, permissions, dashboards and integrations.
Workstream 3	Prototype & development	Build the operational platform and launch with a controlled pilot.
Workstream 4	SOP & adoption	Train staff, define escalation rules and establish daily management routines.
Workstream 5	Enhancement planning	Prioritize OTA, POS, payment, WhatsApp and AI capabilities after core stabilization.

IMPORTANT

Do not sell an oversized application before the process is validated. Sell a controlled operating transformation.

SECTION 02

MARKET CONTEXT & POSITIONING

Use external market signals as a compass, then validate the actual site, access, competition and guest profile before committing capital.

Bali Tourism Snapshot - 2026 Signal

The latest BPS release available on 2 June 2026 shows a strong April rebound in direct foreign tourist arrivals and hotel occupancy.

APRIL FOREIGN ARRIVALS

553,328

+17.21% vs March

STAR HOTEL OCCUPANCY

57.94%

+5.40 pts vs March

NON-STAR & OTHER

34.81%

+1.49 pts vs March

INTERPRETATION FOR THIS PROJECT

Bali remains attractive, but occupancy is not automatic. The project must compete through location, product quality, distribution, service and disciplined revenue management.

Source: BPS-Statistics Indonesia Bali Province, Tourism Overview of Bali Province, April 2026 (released 2 June 2026).

What the Market Data Does - and Does Not - Tell Us

Macro tourism data supports the opportunity. It does not replace a site-specific feasibility study.

Useful signals

- Tourism demand remains active
- Seasonality matters
- Foreign guest mix matters
- Accommodation segments perform differently

What must still be validated

- Exact site access and view
- Local competitor set
- Rate acceptance by segment
- Planning and permit constraints

DECISION RULE

Use Bali demand as the reason to investigate. Use site economics as the reason to invest.

Next validation step: compare at least 10 nearby properties using live OTA observations, direct inquiry tests and field visits.

Priority Guest Segments

The property should not attempt to be everything to everyone. It should design a strong core experience and package it for selected segments.

1	COUPLES / HONEYMOON High willingness to pay for privacy, view, dining and curated moments.	Romantic dinner, photo spots, spa, sunset deck.
2	WELLNESS TRAVELERS Seek calm, nature and intentional routines.	Yoga, massage, healthy menu, guided walks.
3	SMALL FAMILIES Need convenience, safety and clear activity options.	Family unit, breakfast, child-friendly activities.
4	DIGITAL NOMADS Value Wi-Fi, work comfort and longer stay practicality.	Desk, reliable internet, coffee, weekly rate.
5	RETREATS / SMALL GROUPS Can fill shoulder periods with planned programs.	Meeting deck, group meals, activity packages.

Positioning Statement

Premium nature experience, operated with discipline and delivered with modern convenience.

PROPOSED POSITIONING

"A calm, design-led glamping retreat in Bali where nature, hospitality and digital convenience work seamlessly together."

NATURE

Authentic environment and view

COMFORT

Hotel-like sleep and bathroom

SERVICE

Responsive and personal

CONTROL

Reliable operation and data

The differentiator is not "AI hotel" as a gimmick. The differentiator is a premium stay that feels effortless because the system works behind the scenes.

Competitor Benchmark - Field Research Template

Complete this table after the exact site is known. It is intentionally structured for a 10-property live benchmark.

Property	Location	Product	Rate	Review	Direct	Differentiator
Property 01	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 02	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 03	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 04	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 05	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 06	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 07	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 08	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 09	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer
Property 10	Area / distance	Unit type	Rate range	Rating	Direct booking?	Signature offer

FIELD METHOD

Check OTA rates on three dates, contact each property through WhatsApp, test direct booking response time, visit the strongest five competitors, and document the guest experience.

BUSINESS & OPERATING MODEL

Translate the guest promise into revenue streams, operational routines and accountable roles.

JOURNEY TAMU

Business Model Canvas

A property business first; a digital operating template second.

Revenue Engine

Room revenue is the foundation. Ancillary revenue improves guest value and protects margin.

Illustrative revenue mix - stabilized operation

Category	Percentage
Rooms	72%
F&B	14%
Activities	7%
Wellness	4%
Transfer & other	3%

ILLUSTRATIVE MIX

The revenue mix shown above is a planning assumption, not a market forecast. It should be recalibrated after product design and rate testing.

Package Architecture

Build bundles that simplify guest decisions and create structured upsell moments.

Package	Included Value	Business Logic	Priority Segment
SIGNATURE STAY	Room + breakfast + sunset welcome	Default anchor offer	Couples / first-time guests
ROMANTIC ESCAPE	Room + dinner + decoration + photo setup	Premium emotional purchase	Honeymoon / anniversary
WELLNESS RESET	Room + yoga + massage + healthy menu	Higher ancillary value	Wellness travelers
WORK FROM NATURE	Weekly stay + Wi-Fi + coffee + workspace	Longer length of stay	Digital nomads
RETREAT PACKAGE	Rooms + meals + deck + facilitator support	Shoulder-period occupancy	Small groups

SYSTEM IMPLICATION

Packages should exist as configurable products inside the booking engine and POS, not as manual WhatsApp calculat

Guest Journey Map

Every touchpoint should have a clear owner, system action and measurable outcome.

Stage	Guest Touchpoint	Desired System Outcome
Discover	Website, OTA, social media	Qualified traffic, inquiry
Book	Booking engine or assisted WhatsApp	Reservation, guest profile, package
Pay	Payment link / gateway	Deposit, confirmation, reconciliation
Pre-stay	Automated message + staff support	Arrival details, upsell, preferences
Check-in	Front office / mobile flow	Identity verification, unit assignment
Stay	Concierge and service request	Fast response, F&B and activity revenue
Check-out	Invoice, payment, feedback	Clean settlement, review, retention

Service Blueprint

The guest sees a simple experience. Behind it, staff need disciplined workflows and shared data.

Layer	BOOKING	PRE-STAY	F&B	SERVICE	CHECK-OUT
Guest action	Books room	Shares ETA	Requests dinner	Requests towels	Checks out
Visible service	Booking confirmation	Pre-arrival message	Digital menu / staff	Chat / service portal	Invoice & feedback
Backstage action	Reserve inventory	Prepare room	Send order to kitchen	Assign task	Close folio
System record	Reservation + profile	Preferences + arrival	POS ticket	Service request SLA	Payment + review
Control point	No double booking	Room ready status	Charge captured	Escalation if late	Reconciliation

MANAGEMENT RULE

Every guest request must end as a traceable task, transaction or recorded preference. Otherwise the system becomes a decorative dashboard.

Lean Organization Model

A 12-unit property can begin with a compact team, provided roles and escalation rules are clear.

1	OWNER / DIRECTOR	Investment, strategy, approvals
2	GENERAL MANAGER	Daily performance, guest quality, people
3	FRONT OFFICE / CONCIERGE	Reservation, arrival, request ownership
4	HOUSEKEEPING	Room readiness, linen, minibar control
5	F&B / EXPERIENCE	Orders, service, activities coordination
6	FINANCE / ADMIN	Cash, reconciliation, purchasing, reports
7	DIGITAL SUPPORT	System, integrations, issue management

Daily Operating Rhythm

Digital tools only create value when they are embedded into a daily management routine.

Time	Routine	Control Focus
07:00	Morning readiness	Review arrivals, departures, dirty rooms, breakfast and maintenance blockers.
10:00	Checkout wave	Close folios, inspect rooms, assign cleaning and prioritize next arrivals.
13:00	Arrival readiness	Confirm ready rooms, guest ETA, airport transfers, packages and special requests.
16:00	Experience window	Monitor service requests, F&B orders, activities and guest sentiment.
21:00	Night control	Review unresolved tasks, payment status, tomorrow arrivals and incident log.
Weekly	Owner review	Occupancy, ADR, revenue mix, reviews, cost issues and improvement actions.

OPERATING HABIT

The dashboard should support the routine. It should never replace management presence on the property.

SECTION 04

SMART GLAMPING OS

A modular operating platform: basic first, integrated next, AI-enabled only when the foundation is stable.

BOOKING

Kelola reservasi dan okupansi

kerusak

The Problems the System Must Solve

The MVP should solve operational friction before adding advanced features.

RESERVATION
WhatsApp inquiries, spreadsheets and OTA bookings create double-entry risk.

ROOM STATUS
Staff do not share one real-time view of dirty, cleaning, ready and out-of-order rooms.

GUEST REQUEST
Requests can disappear inside chat groups and verbal instructions.

REVENUE LEAKAGE
Ancillary orders may not be consistently captured, charged and reconciled.

MANAGEMENT VISIBILITY
Owner receives late summaries instead of real-time operational facts.

GUEST MEMORY
Preferences, complaints and visit history are not converted into usable CRM data.

Smart Glamping OS - Module Overview

The platform is a single operational backbone. Each module can be activated in sequence.

Module	What It Controls	Priority
RESERVATION	Inventory, rates, bookings, check-in/out	MVP
GUEST CRM	Profile, history, preference, notes	MVP
HOUSEKEEPING	Room status, assignment, inspection	MVP
SERVICE REQUEST	Guest needs, task SLA, escalation	MVP
REPORTING	Occupancy, revenue, status, task log	MVP
PAYMENTS	Deposit link, status, reconciliation	Phase 2
POS	F&B, activities, charge-to-room	Phase 2
CHANNEL MANAGER	OTA availability and rate sync	Phase 2
AI LAYER	Concierge, insight, review analytics	Phase 3

System Architecture

Keep the first architecture simple: one application, one database, controlled integrations.

Module 1 - Reservation & Occupancy

The first source of truth: what is booked, available, blocked, dirty or out of order.

Availability calendar Daily and monthly room view	Reservation record Guest, source, unit, rate, package, payment
Rate and promo Manual configuration for MVP	Check-in / out Arrival and departure status
Room block Maintenance, owner use, operational closure	Audit trail Who changed what and when

MVP ACCEPTANCE CRITERIA

Staff can answer three questions in under 30 seconds: Which units are available? Which units are ready? Which arrivals require action?

Module 2 - Guest CRM

A guest database is not a mailing list. It is the memory of the hospitality operation.

Data Group	Minimum Information
Identity	Name, nationality, contacts, consent, booking source
Stay history	Past bookings, rates, packages, visit frequency
Preference	Food notes, room preference, activity interest
Service log	Requests, complaints, incidents and resolution
Commercial value	Room revenue, ancillary spend, repeat potential
Communication	Pre-stay message, follow-up, review and reactivation

PRIVACY RULE

Collect only what is useful, secure it properly, define access rights, and retain data according to a documented policy.

Module 3 - Housekeeping & Service Requests

The system must translate guest needs into tasks with owners, deadlines and escalation.

Workflow	Required Control
Housekeeping task	Unit, assignee, status, timestamps, inspector, notes
Guest request	Guest, unit, request type, priority, assignee, due time
Escalation	Late task alert, unresolved request, manager notification
Maintenance link	Out-of-order flag, ticket creation, unit reopening approval
Daily report	Open tasks, SLA breaches, room readiness and blockers

Module 4 - POS, Activities & Ancillary Revenue

Sell beyond the room, but make every sale visible, attributable and reconcilable.

ROOM CHARGE SHOULD BECOME A FIRST-CLASS FEATURE

F&B, spa, transport and activities should be connected to the guest folio or paid directly through a clear transaction flow.

F&B ORDER Menu, item, qty, outlet, payment	ACTIVITY Availability, operator, guest, margin	SPA / WELLNESS Slot, therapist, package, charge
TRANSFER Pickup, driver, route, guest	INVENTORY Basic stock and low-stock alert	RECONCILIATION Daily sales and settlement

Benchmark note: Mews positions hotel POS as connected to PMS and payments, with digital ordering, room charges and real-time reporting.

Module 5 - Payment & Reconciliation

Do not build a payment gateway. Integrate a regulated provider and design a clean operational process.

Process	Recommended Method	Control
Booking deposit	Payment link or checkout page	Reservation status updates after callback / confirmation
Balance payment	Before arrival or checkout	Clear folio and payment status
On-site purchase	POS or charge-to-room	Captured against outlet and guest
Refund / cancellation	Authorized workflow	Reason, amount, approver, audit trail
Daily settlement	Finance review	Sales report matched to provider settlement

INDONESIA CONTEXT

Midtrans publicly lists methods such as GoPay, QRIS, virtual accounts and debit or credit cards. QRIS is the national QR payment standard introduced by Bank Indonesia.

Owner Dashboard - What Matters Daily

The first dashboard should be operationally useful, not visually crowded.

OCCUPANCY TODAY

Maintenance

1

Cadence	Management View
Today	Occupancy, arrivals, departures, dirty rooms, unpaid reservations, overdue tasks
Weekly	ADR, revenue mix, reviews, repeat guest, source performance, service SLA
Monthly	Revenue, cost ratio, channel mix, package performance, maintenance, improvement plan

Distribution Strategy - OTA and Direct Booking

OTA is a demand channel. It should not become the owner of the guest relationship.

OTA ROLE

- Market reach
- Early trust
- Demand capture
- International exposure

DIRECT ROLE

- Brand control
- Guest database
- Lower channel dependency
- Package flexibility

CONTROL PRINCIPLE

Use a channel manager when multiple online channels are active so rates and availability can be synchronized without manual duplication.

Mews distinguishes PMS from channel manager: the PMS manages internal operations, while the channel manager updates rates and availability across online booking channels.

AI Layer - Add Only After the Core Works

AI should help staff respond faster and help management learn. It should not be trusted to run uncontrolled transactions.

Use Case	Business Value	When	Guardrail
AI Concierge	Answer FAQs, propose activities, draft replies, route requests	Phase 3	Human handoff for exceptions
Review Analytics	Summarize recurring praise and complaints	Phase 3	Manager validates actions
Upsell Recommendation	Suggest relevant packages based on context	Phase 3	Rules and approval limits
Demand Insight	Highlight occupancy pattern and rate opportunities	Phase 3	Manager sets price policy
Knowledge Assistant	Answer staff questions from SOP and property info	Phase 3	Use approved knowledge base

AI DESIGN RULE

AI may recommend, summarize and assist. Sensitive actions, refunds, price overrides and incident handling require accou

AI Gateway Design - OpenRouter Option

A model gateway can reduce vendor lock-in and improve resilience, but it still needs logging, spend limits and approved model policies.

Design Element	What It Means	Why It Matters
Unified API	One integration layer for multiple models	Simpler experimentation and switching
Model fallback	Try fallback models when the primary model errors	Improved service continuity
Routing policy	Choose preferred providers or latency / cost strategy	Operational control
Usage monitoring	Track model used and token consumption	Budget governance
Knowledge boundary	Send only necessary property context	Privacy and quality control

OFFICIAL DOCUMENTATION NOTE

OpenRouter documents a unified API and model fallback behavior: an ordered list of model IDs can be used so another model is attempted when the primary model returns an error.

Recommended Technology Stack - MVP

Use mature components. Build the business logic that is unique to the property.

Layer	Recommended Direction	Purpose
Domain & DNS	.com domain + managed DNS	Brand, routing and control
Web application	Next.js or Laravel-based application	Owner dashboard and staff portal
Database	PostgreSQL	Reservation, CRM, tasks and transactions
Infrastructure	Cloud VPS with backup	Cost-effective MVP hosting
Storage	Object storage	Images, documents and operational files
Payment	Midtrans or comparable gateway	Avoid building regulated payment rails
Messaging	WhatsApp Business Platform integration	Guest communication and service flow
AI gateway	OpenRouter or direct model API	Optional Phase 3 intelligence layer
Monitoring	Uptime, logs, backup and alerts	Operational reliability

Infrastructure Procurement Checklist

Buy the foundations before development begins so ownership and access are clean from day one.

Item	Minimum Preparation	Account Owner
DOMAIN	Primary .com domain and backup variation	Owner account
EMAIL	Role-based email: booking, finance, admin	Owner account
CLOUD	VPS, DNS, SSL, backup, monitoring	Technical admin
PAYMENT	Merchant registration and settlement account	Owner / finance
WHATSAPP	Official business number and Meta business setup	Owner / marketing
ANALYTICS	Web analytics and conversion tracking	Marketing
CONTENT	Photography, unit information, policies, FAQ	Operations
SOP	Booking, cancellation, payment, incident, escalation	General manager

CONTROL RULE

Critical accounts should belong to the business owner, not to an external developer or agency.

Security & Data Governance

Hospitality data includes personal identity, contact information, stay history and financial records. Protect it from day one.

Control	Minimum Standard
Access control	Role-based login; restrict finance, refund and admin access.
Audit trail	Record edits, status changes and approvals.
Backups	Automated database backup with restore testing.
Secrets	Store API keys securely; never hardcode credentials in public repositories.
Data minimization	Collect only information needed for service and compliance.
Retention	Define how long documents and guest data are kept.
Incident response	Define who acts when a breach, outage or payment issue occurs.
Vendor review	Check provider terms, security and data handling before integration.

DELIVERY, FINANCE & CONTROL

Turn the blueprint into a phased project with clear scope, budget discipline, KPI and owner decisions.

MVP Scope - 12 Week Build

Keep the launch narrow enough to stabilize quickly and useful enough to change daily operations.

Epic	Area	Launch Output
Epic 1	User & access	Admin, manager, front office, housekeeping roles
Epic 2	Reservation	Calendar, unit inventory, booking, status, source, notes
Epic 3	Guest CRM	Profile, stay history, preference and communication log
Epic 4	Housekeeping	Dirty-clean-ready workflow, assignment and inspection
Epic 5	Service request	Request types, priority, assignee, SLA and escalation
Epic 6	Reporting	Occupancy, arrival, departure, unit status, task report
Epic 7	Basic finance	Payment status, invoice note, daily reconciliation export
Epic 8	Launch readiness	Training, SOP, backup, monitoring, support process

12-Month Delivery Roadmap

Each phase earns the right to move to the next phase.

Delivery Team & RACI

A compact project needs named decision owners, not a large committee.

Activity	Owner	Project Lead	Developer	Operations
Business process	A	R	C	C
MVP priorities	A	R	C	C
Design approval	A	R	C	C
Development	I	C	R	C
Payment onboarding	A	R	C	R
SOP & training	C	A/R	C	R
Go-live decision	A	R	C	C
Support escalation	I	A/R	R	R

LEGEND

A = accountable | R = responsible | C = consulted | I = informed

Digital Implementation Budget - Discussion Range

Budget is presented as a range because final cost depends on integrations, design depth and support model.

Component	Illustrative Range
Discovery, process map, wireframe	Rp 15-35 million
Core MVP application	Rp 60-150 million
Payment / messaging / OTA integration	Rp 20-80 million
Training, SOP and launch support	Rp 10-35 million
Cloud, domain, monitoring, API	Rp 1-5 million / month
Maintenance & improvement retainer	Rp 5-20 million / month

ILLUSTRATIVE ALLOCATION OF IMPLEMENTATION BUDGET

IMPORTANT

This range covers the digital operating system only. It excludes land, building, interior, utilities, recruitment, operating capital and physical equipment.

Illustrative Operating Scenarios

These are decision-support scenarios, not a feasibility study. Replace assumptions after site and competitor validation.

Variable	Lean Pilot	Baseline	Growth
Units	8	12	20
Occupancy	55%	60%	65%
Average daily rate	Rp 1.70 M	Rp 1.90 M	Rp 2.20 M
Ancillary revenue	20% of room	25% of room	30% of room
Room revenue / year	Rp 2.73 B	Rp 4.99 B	Rp 10.44 B
Gross revenue / year	Rp 3.28 B	Rp 6.24 B	Rp 13.58 B

FORMULA

Room revenue = units x 365 days x occupancy x ADR. Gross revenue = room revenue x (1 + ancillary revenue ratio).

Illustrative Revenue Envelope

The baseline scenario reaches approximately Rp 6.24 billion annual gross revenue before tax and before operating costs.

USE CORRECTLY

This chart is for sizing and discussion. It is not a promise of performance. A proper feasibility study must model seasonality, channel fees, payroll, utilities, F&B costs, taxes, depreciation and financing.

Digital ROI Levers

Do not justify the system with vague claims. Track the operational mechanisms that can change revenue or cost.

Value Lever	System Mechanism	KPI
Reduce double booking risk	Single inventory view	Booking conflict count
Improve room readiness	Housekeeping status and priority	Late-ready room count
Improve direct conversion	Branded booking and fast response	Direct booking share
Capture ancillary spend	POS and guest folio	Ancillary revenue per stay
Shorten response time	Service request SLA	Median response time
Reduce reconciliation effort	Integrated payment records	Finance hours per week
Improve repeat potential	CRM and follow-up	Repeat guest ratio

Management KPI Set

A small property should use a small KPI set consistently.

Area	KPI	Definition	Cadence
Demand	Occupancy rate	Occupied room nights / available room nights	Daily / monthly
Pricing	ADR	Room revenue / occupied room nights	Daily / monthly
Revenue	RevPAR	Room revenue / available room nights	Daily / monthly
Ancillary	Ancillary per stay	Non-room revenue / stays	Weekly / monthly
Service	Median request response	Time from request to first action	Daily
Quality	Guest satisfaction	Rating and review themes	Weekly
Operation	Ready-room compliance	Rooms ready before promised check-in	Daily
Channel	Direct booking share	Direct bookings / total bookings	Monthly
People	Labor cost ratio	Labor cost / revenue	Monthly

Risk Register

Manage risk actively; do not treat it as a slide at the end of the project.

Risk	Likelihood	Impact	Mitigation
Wrong site economics	High	High	Complete site-specific feasibility and competitor validation before major capex.
Permit or spatial constraint	High	High	Verify zoning, OSS pathway and local approvals with qualified professionals.
Overbuilding the MVP	Medium	High	Freeze launch scope and move extras to later backlog.
Low staff adoption	Medium	High	Train with real workflows and daily management routines.
Payment / integration failure	Medium	Medium	Use sandbox, callback logs, reconciliation and fallback procedures.
Guest data leakage	Low	High	Role-based access, backups, secrets management and vendor review.
AI gives wrong answer	Medium	Medium	Property-specific knowledge, guardrails and human handoff.
OTA dependency	Medium	Medium	Build direct booking and CRM from day one.

Legal & Permitting Checklist

This blueprint is not legal advice. Validate the exact business model and site with local professionals before committing capital.

Due Diligence Area	Required Validation
Land and spatial use	Confirm land status, zoning and permitted use for the selected site.
Business entity	Determine entity structure, ownership and investment arrangements.
OSS / NIB	Register business activities and obtain the appropriate OSS pathway.
Accommodation classification	Confirm the applicable accommodation category and standards.
Building and utilities	Validate building approvals, water, waste, electricity and fire safety requirements.
Environment and community	Assess environmental obligations and local community engagement.
Food and beverage	Confirm permits and operational standards if restaurant service is provided.
Data and payments	Document privacy, payment provider and customer communication procedures.

OFFICIAL REFERENCE

Use the OSS portal and the current KBLI framework as starting points. The correct classification depends on the final accommodation and operating model.

First 90 Days - Practical Action Plan

The immediate objective is not to build every feature. It is to remove uncertainty and prepare a controlled launch plan.

Period	Focus	Deliverables
Days 1-15	Clarify project	Confirm site, owner goals, unit plan, target guests, commercial model, roles and available budget.
Days 16-30	Validate market	Benchmark nearby properties, test rates, map competitor experience, interview potential guests.
Days 31-45	Design operation	Map end-to-end workflow, SOP, staffing model, service standards and owner dashboard.
Days 46-60	Design MVP	Finalize module scope, wireframes, tech stack, accounts, integrations and delivery plan.
Days 61-90	Build pilot	Develop core modules, test with scenarios, train staff, define support and prepare soft launch.

Owner Decisions Required

Use this page as the agenda for the first serious workshop with the business owner.

- 1 What is the exact site, land status, access condition and surrounding attraction profile?
- 2 How many accommodation units are planned for the first launch and what are the room types?
- 3 Is the property positioned as couples retreat, wellness escape, family glamping, workation or a focused combination?
- 4 Which services will be operated internally: breakfast, restaurant, spa, transport and activities?
- 5 What is the intended launch budget and target opening date?
- 6 Will the system be custom-built, purchased from an existing PMS provider or developed as a hybrid?
- 7 Who is accountable for operations, who approves changes and who owns all digital accounts?
- 8 What business data will be collected from day one to evaluate the property objectively?

Recommended Next Move

Proceed as a structured owner workshop, not as an unbounded software pitch.

THE PROPOSAL IN ONE SENTENCE

Build a premium glamping operation with a digital backbone from day one, then add integrations and AI only after the core process is stable.

- 1

Owner workshop

Confirm physical concept, business goals and MVP scope.
- 2

Site validation

Benchmark, permits, rate testing and feasibility assumptions.
- 3

MVP design

Process map, wireframes, accounts, roles and backlog.
- 4

Pilot build

Launch core operational system and daily routines.
- 5

Enhance

Integrations, POS, AI and scaling options.
